NMR History

First NMR Spectra on Water

^1H NMR spectra of water

FIG. 10. Photographic record of the proton signal in water. The four traces from top to bottom correspond to the times t_1 , t_2 , t_3 , t_4 of Fig. 9. In the text they are referred to as a , b , c , d , respectively.

NMR History

First Observation of the Chemical Shift

^1H NMR spectra ethanol

Modern ethanol spectra

Nobel prizes

1944 *Physics* Rabi (Columbia)

"for his resonance method for recording the magnetic properties of atomic nuclei"

1991 *Chemistry* Ernst (ETH)

"for his contributions to the development of the methodology of high resolution nuclear magnetic resonance (NMR) spectroscopy"

2002 *Chemistry* Wüthrich (ETH)

"for his development of nuclear magnetic resonance spectroscopy for determining the three-dimensional structure of biological macromolecules in solution"

1952 *Physics* Bloch (Stanford), Purcell (Harvard)

"for their development of new methods for nuclear magnetic precision measurements and discoveries in connection therewith"

2003 *Medicine* Lauterbur (University of Illinois in Urbana), Mansfield (University of Nottingham)

"for their discoveries concerning magnetic resonance imaging"

History of MRI

1971: Raymond Damadian uses NMR for tumor detection

1972: Lauterbur suggests NMR could be used to form images using gradients

1977: Peter Mansfield proposes echo-planar imaging (EPI) to acquire images faster

1977: first MRI scanner (0.05 T) created by Damadian's FONAR corporation, named "Indomitable"

1977: First MR image of human body

- Didn't use EPI
- Each voxel took 2 min; 106 voxels
- 4 hours to get one slice

Nuclear Magnetic Resonance

Nuclear spin

$$\mu = \gamma I \hbar$$

μ - magnetic moment

γ - gyromagnetic ratio

I - spin quantum number

\hbar - Planck's constant

I is a property of the nucleus

Mass #	Atomic #	I
Odd	Even or odd	$1/2, 3/2, 5/2, \dots$
Even	Even	0
Even	Odd	1, 2, 3

NMR Periodic Table

NMR “active” Nuclear Spin (I) = $1/2$:

^1H , ^{13}C , ^{15}N , ^{19}F , ^{31}P

biological and chemical relevance

Odd atomic mass

$I = +1/2$ & $-1/2$

NMR “inactive” Nuclear Spin (I) = 0:

^{12}C , ^{16}O

Even atomic mass & number

Quadrupole Nuclei Nuclear Spin (I) $> 1/2$:

^{14}N , ^2H , ^{10}B

Even atomic mass & odd number

$I = +1$, 0 & -1

Element	Atomic mass	Spin I	Natural abundance (%)	Receptivity ($^{13}\text{C} = 1.00$)	Quadrupole moment (10^{30} m^2)	Resonant frequency (MHz) at 2.348 T

Apply an external magnetic field

(i.e., put your sample in the magnet)

$$\omega = \gamma B_0 = \nu/2\pi$$

ω - resonance frequency
in radians per second,
also called Larmor frequency

ν - resonance frequency
in cycles per second, Hz

γ - gyromagnetic ratio

B_0 - external magnetic
field (the magnet)

Spin 1/2 nuclei will have two
orientations in a magnetic field
+1/2 and -1/2.

Net magnetic moment

Ensemble of Nuclear Spins

$$\vec{B}_0 = 0$$

Randomly oriented

$$\vec{B}_0 > 0$$

Highly oriented

Each nucleus behaves like a bar magnet.

Allowed Energy States for a Spin 1/2 System

Therefore, the nuclei will absorb radiation with energy ΔE resulting in a change of the spin states.

Spins Orientation in a Magnetic Field (Energy Levels)

- Transition from the low energy to high energy spin state occurs through an absorption of a photon of radio-frequency (RF) energy

Frequency of absorption: $\nu = \gamma B_0 / 2\pi$

Resonance technique

The NMR Experiment

Continuous Wave

- Sample is dissolved in suitable solvent
- Solvent is generally CDCl_3 (no protons)
- Placed in thin glass tube (highly purified glass is used)
- Tube is placed in magnetic field
- Radiofrequency is used to excite nuclei and to spin flip

Sample
in tube

Radiofrequency
generator

Detector and
amplifier

**CW NMR 40MHz
(1960)**

Magnetization

Boltzmann

$$\frac{N_{+1/2}}{N_{-1/2}} = \exp(+\Delta E/k_B T)$$

$$\Delta E \equiv E_{-1/2} - E_{+1/2} = \hbar\omega_L$$

$$N = N_{+1/2} + N_{-1/2}$$

Magnetization

$$M \propto N_{+1/2} - N_{-1/2}$$

NMR Signal (sensitivity)

Since:

$$\Delta E = h\nu$$

and

$$\nu = \gamma B_0 / 2\pi$$

then:

$$N_\alpha / N_\beta = e^{\Delta E / kT} \quad \Rightarrow \quad N_\alpha / N_\beta = e^{(\gamma h B_0 / 2\pi kT)}$$

The ΔE for ^1H at 400 MHz ($B_0 = 9.39 \text{ T}$) is $6 \times 10^{-5} \text{ Kcal / mol}$

$$N_\alpha / N_\beta = 1.000060$$

Very Small !
~ 60 excess spins per
million in lower state

Energy vs Field strength

Boltzmann Equation

$$\frac{N_{\beta}}{N_{\alpha}} = e^{(\Delta E/kT)} \sim 1 - \Delta E/kT$$

Where $k=1.3805 \times 10^{-23} \text{ J K}^{-1}$
T is the temperature

e.g. with $B_0=1.4 \text{ T}$ ($v_L=60 \text{ MHz}$)

$\Delta E_H \sim 2.4 \text{ J/mol}$ At $T=300\text{K}$

$$N_{\beta} = .9999904 N_{\alpha}$$

with $B_0=7.05 \text{ T}$ ($v_L=300 \text{ MHz}$)

$$N_{\beta} = .99995 N_{\alpha}$$

Sensitivity of NMR Experiments

The sensitivity of pulsed FT-NMR is given by the signal to noise ratio:

$$\left(\frac{S}{N} \right) = N T_2 \frac{\sqrt[3]{B_0 \gamma_{\text{det}}} \sqrt{Ns}}{T}$$

N = number of spins in the system-sample concentration

T_2 = transverse relaxation time

γ_{det} = magnetogyric ratio of detected nucleus

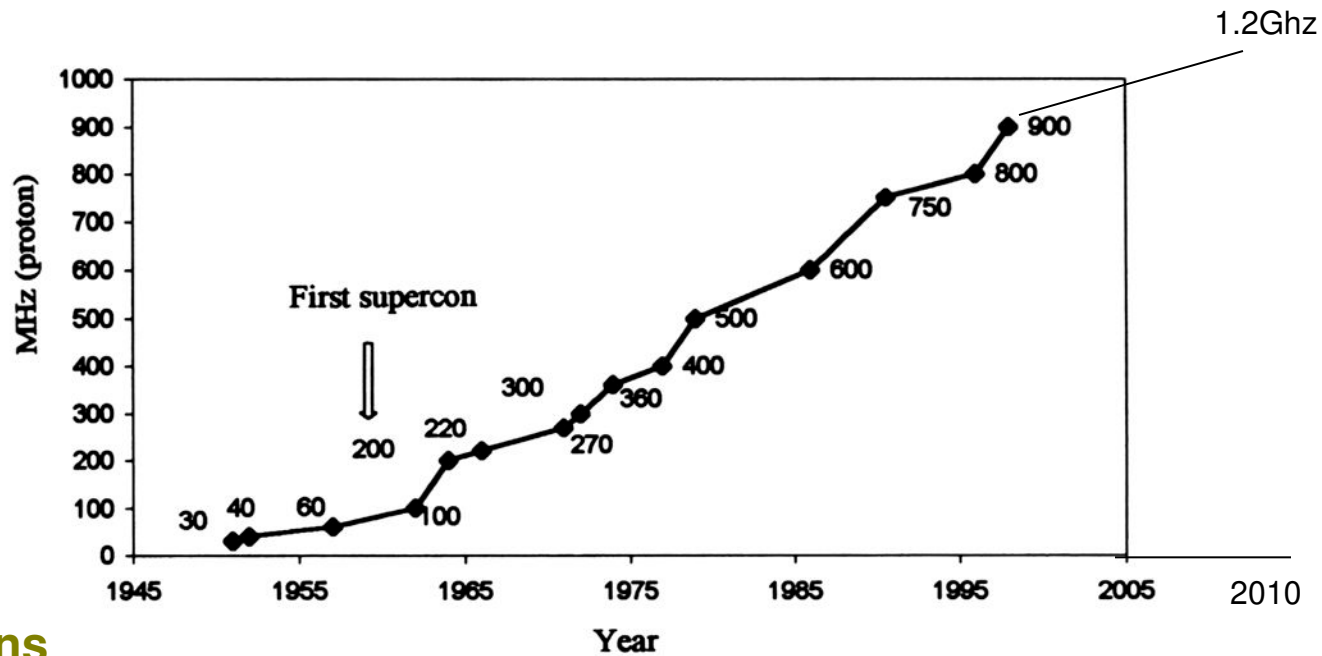

Ns = number of scans

B_0 = external field strength

T = sample temperature

NMR Sensitivity

Increase in Magnet Strength is a Major Means to Increase Sensitivity

Signal to noise improvement with magnetic field (sensitivity)

NMR Sensitivity

But at a significant cost!

~ \$800,000

~ \$2,00,000

~ \$4,500,000

Classical

Classical Description

- *Spinning particle precesses around an applied magnetic field*

A Spinning Gyroscope
in a Gravity Field

Simplified Bloch equations

The return to equilibrium is generally (mono) exponential

$$\frac{dM_z}{dt} = \frac{M_0 - M_z}{T_1}$$

T_1 is the spin-lattice relaxation time constant

$$\frac{dM_{xy}}{dt} = -\frac{M_{xy}}{T_2}$$

T_2 is called the spin-spin relaxation time constant

Classical Description

- **NMR Pulse**
 - Applying the B_1 field for a specified duration (Pulse length or width)
 - Net Magnetization precesses about B_1 a defined angle (90° , 180° , etc)

Relaxation of M_{xy} During Fourier Transform NMR

Responses Due to T_1 AND T_2

For liquids in porous media $T_1 \gg T_2$

Classical Description

- *Observe NMR Signal*
 - **Remember:** a moving magnetic field perpendicular to a coil will induce a current in the coil.
 - The induced current monitors the nuclear precession in the X,Y plane

$$\nu = \gamma B_0 / 2\pi$$

Experimental setup

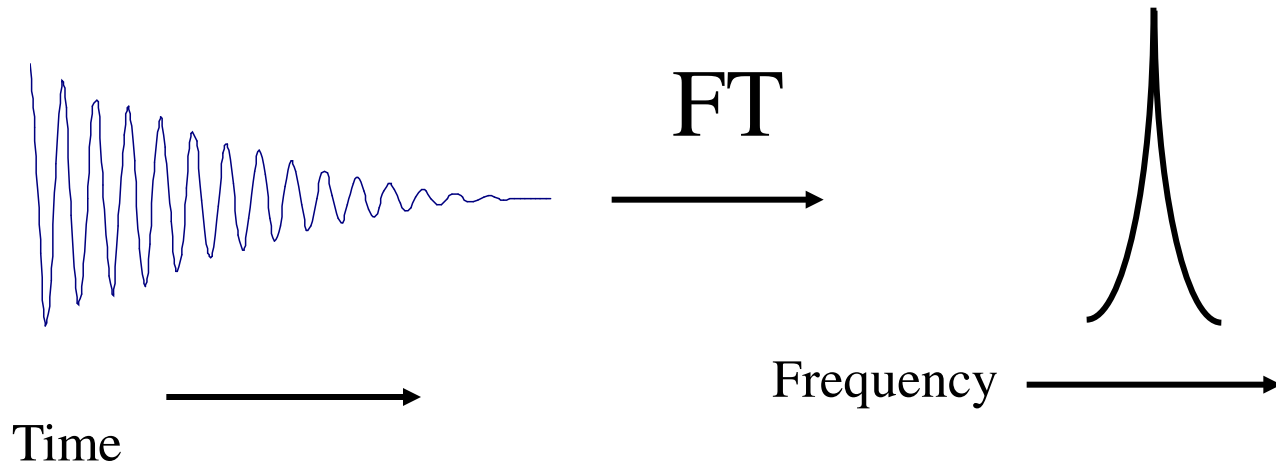

After 90° pulse Free Induction Decay

The signals decay away due to interactions with the surroundings.

A free induction decay, FID, is the result.

Fourier transformation, FT, of this time domain signal produces a frequency domain signal.

Free Induction Decay (FID)

FID = the sum of all of the nuclei radiating absorbed rf as they return to the Ground State. The information in the FID is a function of time and must be converted via Fourier Transform to the frequency domain to produce a Readable spectrum.

An NMR-based metabolomics study of pork from different crossbreeds and relation to sensory perception

Fig. 3. PLS score (a and b) and loading (c and d) plots showing the means of the sensory profile and the polar metabolites from the meat extraction (a and c) and the freeze-thaw drip (b and d) from the five crossbreeds. For the metabolites from the meat extraction, the first two principal components (PC1 and PC2) explain 81 and 11% of the variance, respectively (c). Whereas for the metabolites from the freeze-thaw drip PC1 and PC2 explain 83 and 9% of the variance, respectively (d). "O", odour, "F", flavour, and "AT", aftertaste. Grey boxes show metabolites, and magenta circles show attributes assessed by the sensory panel. Abbreviations as in Table 2.

Abstract

Low field nuclear magnetic resonance (NMR) is used as a non-invasive method for detecting spoiled tomato paste. It is shown that the ^1H T_1 and T_2 relaxation times change as tomato paste spoils due to changes in viscosity and/or changes in the concentration of paramagnetic compounds. With the goal of developing a spoilage detector that can be used in a tomato processing facility, a $\gamma B_0 = 19.5$ MHz single-sided handheld NMR instrument is used. Due to the dominance of diffusion on relaxation measurements made with the single sided instrument, the slope of the amplitude of a spin echo for three different delay times is used to provide a viscosity dependent parameter that permits the differentiation between pristine and spoiled tomatoes.

One-Sided NMR – Non-Invasive Analysis of Tomato Paste

Rapid determination of the fat content in packaged dairy products by unilateral NMR

Figure 1. Schematic representation of the magnet array consisting of three block magnets (a). The sensitive spot (c) is located ~1 cm above the face of the magnet. The magnet spacings are optimised to produce a locally homogeneous field in this region creating a relatively large MR sensitive volume above the surface RF coil (b).

Figure 5. Transverse relaxation time of the fat component T_2^{fat} as a function of the inverse fat content for all studied samples.

Not enough difference, i.e.,
10.000 in order to find small
pieces

Example
Plastic + water

Introduction

NMR signal

Spectroscopy

T1-T2 relaxation

Diffusion

Imaging

Plastics

Conclusions

Conclusions

- Plastic gives NMR signal
- Can not generate specific signal only due to plastic
- Will be inverse, i.e., no signal where plastic is
 - (or glass, bones etc)
 - Enough time > super technique
- At this moment still too much research instrument, which large promise (if costs go down)
- Additional NMR problems
 - Magnetization time on conveyor (too short or super high field)
 - High homogeneity
 - Safety

TABLE 2 Applications of noninvasive techniques for detecting foreign bodies

Mode	Food products	Foreign bodies	References
X-ray	Loaf of bread, a hamburger steak, nd cabbage	Steel screws, aluminum rivets, staples, aluminum foil, glass and plastic fragments	(Morita et al., 2003)
	Chili soup	Metals and bone fragments	(Chen et al., 2005)
	Instant ramen, macaroni, and spaghetti	Stainless steel, Teflon, aluminum, rubber, glass, and ceramics	(Kwon et al., 2008)
	Fish fillets	Bones	(Mery et al., 2011)
	Minced meat, cultured sour cream product	Glass, paper, a ladybug, a cigarette butt, and a fly	(Nielsen et al., 2013)
	Food jar	Glass fragments	(Lu & Peng, 2013)
	Bakery product and powder seasoning	Glass fragment and metal particles	(Niemeyer, 2015)
	Milk powder, minced meat	Polyethylene plastic, hay powder, and hollow cylinder	(Li et al., 2015)
	Cheese, minced milk, wheat bread	Glass, metal, wood, insects, plastic, rubber, and stones	(Einarsdóttir et al., 2016)
Thermal Imaging	Raisins, nuts, almonds	Wooden sticks and stones	(Meinlschmidt & Maergner, 2002)
	Raisins, almonds, nuts	Wooden sticks, stone, metal, and cardboard	(Ginesu, Giusto, Märgner, & Meinlschmidt, 2004)
	Chocolate bar	Stone, plastic, and glass fragments	(Bukowska-Belniak, Leśniak, Kielkowski, & Michalski, 2010)
	Biscuits	Stone, glass, plastic, wood, paper, and textile fiber	(Senni et al., 2014)
Near-infrared (NIR) spectroscopy	Blueberries	Leaves, twigs, and stones	(Tsuta et al., 2006)
	Dough, cheese, doughnut, meat	Coin, glass ball, and rubber	(Pallav, Diamond, et al., 2009)
	Blueberries	Leaves and stems	(Sugiyama et al., 2010)
	Ham slice and chocolate	Hairs and insects	(Tashima et al., 2013)
	Ham slice, fish, and chicken wing sticks	Wooden sticks and bones	(Phetchalem et al., 2014)
	Shell and pulp	Walnut	(Jiang et al., 2007)
	Chicken breast fillets	Bone fragments	(Yoon et al., 2008)
	Semolina	Insect fragments	(Bhuvaneswari et al., 2011)
Pork steaks	Polyethylene terephthalate, polyethylene, metal, insects, and bone	(Díaz, Cervera, Fenollosa, Ávila, & Belenguer, 2011)	
Hyperspectral imaging (HSI)	Grains	Plastic shards, glass beads, and rubber fragments	(Gowen & O'Donnell, 2013)
Ultrasonic	Marmalade and cheese product	Bone, glass, steel, and wood	(Hæggström & Luukkala, 2001)
	Bottled beverages	Metal, glass, and plastic pieces	(Zhao et al., 2003)
	Bottled beverages	Glass fragment	(Zhao et al., 2006)
	Deboned chicken	Bone fragment	(Correia et al., 2008)
	Cheese	Plastic pieces	(Leemans & Destain, 2009)
	Canned food	Rock and aluminum plate	(Meftah & Mohd Azimin, 2012)
	Cheese and poultry product	Metal rod, metal, and glass fragment	(Cho & Irudayaraj, 2003)
	Canned beverages	Copper and aluminum rods	(Ho et al., 2007)
Cheese	Wood, rubber, and glass	(Pallav, Hutchins, & Gan, 2009)	
Terahertz	Chocolate	Stone, glass, and plastic fragments	(Jördens & Koch, 2008)
	Flour sample	Aluminum foil, metallic cubes, cubic stones, grasshopper, and mealworms	(Kim et al., 2012)
	Noodle	Aluminium, granite, and insects	(Lee et al., 2012)
	Crackers product	Dried fish and metal fragment	(Han et al., 2012)
	Instant noodles	Crickets species	(Ok et al., 2012)
	Powdered milk	Insect, polymer, and metals	(Ok et al., 2014)
	Powdered milk	Metal razor and rubber fragments	(Lee & Lee, 2014)
	Powder	Teflon and Polyvinyl chloride (PVC)	(Ikari et al., 2014)
	Chocolate product	Caterpillar	(Yu et al., 2015)

Designing sensors to detect foreign bodies in food

March 31, 2017, Elhuyar Fundazioa

Image obtained with this technology in which there can be seen, on a slice of sausage, plastics, metals and splinters of glass of different sizes and shapes. Credit: Elhuyar Fundazioa

Researchers at the NUP/UPNA-Public University of Navarre and the Navarre-based company Anteral S.L. have designed a novel system of sensors to improve quality control in the food sector and based on terahertz technology. These devices enable foreign bodies, such as metals, paper, insects, plastic or glass to be detected in food along a production line, and pathogenic microorganisms to be identified in real time.

These devices are based on [terahertz technology](#), a band in the [electromagnetic spectrum](#) located between the microwaves and infrared waves. This terahertz band is the last unexplored region of the electromagnetic spectrum owing to the difficulty in generating and detecting waves of this type. Yet one of the fields in which terahertz offer huge technological potential is in the sensing of substances and materials. This is due to the fact that nearly all the molecules display a characteristic footprint on this band and this allows them to be distinguished and identified.

"Seeing" inside substances

"Terahertz radiation is capable of penetrating a huge range of objects and substances, so they make it possible to 'see' what is inside them," explained

Juan Carlos Iriarte. "In the same way, the reflection of [terahertz waves](#) varies according to the material or body they impact upon, and this provides images depending on the power and phase of the wave received."
